broncolor Minicom 160 RFS – with more power

broncolor, the Swiss lighting specialist has expanded the Minicom product line with a further attractive innovation: the new Minicom 160 RFS with 1200 J. The power can be adjusted over a 5 f-stop range in whole-stop and 1/10 f-stop intervals. The Minicom 160 RFS provides a powerful 650 W modelling light. Therefore, this new unit is especially interesting for photographers taking shots of large groups of people, architecture or still and advertising photography.

Minicom 160 RFS offers excellent repetitive precision for digital photography. Every function of the monolight can be controlled by radio from the RFS transmitter or computer. The choice of 8 digital radio channels ensures that even in large studios, the signal will be reliably transmitted. With the software „bron Studio“ you can now enter lighting settings directly on screen (PC or Mac). The flash can be triggered by radio or infrared signal (amongst others).

The monolight Minicom 160 RFS is compatible with the latest broncolor power packs and light shapers. Attachments can be quickly mounted and removed using the patented bayonet with release button. Especially when rectangular reflectors and softboxes are used for light control, 360-degree rotation capability is a great advantage.

Introduction on the market is planned for October 2010.
